THE 1952 CROP SEASON

Crop yields in Indiana for 1952 were 107 percent of the 1941-50 averages. The 1952 yields averaged 92 percent of the record yields for each crop. No major crop made less than an average yield. Soybeans with a record yield and wheat with the second highest yield of record carried the heaviest weights in making the excellent showing. The monthly condition of pasture was above average until July, but deteriorated following July to make the season average 81, or two points below the 10-year average.

The fall of 1951 was relatively dry and farmers were able to seed all the winter grain acreage they intended. However, germination was slow because of lack of moisture during October. Winter began unusually early in 1951 with near zero temperatures early in November. Early seeded wheat got off to a good start but late seeded wheat, following soybeans, had very little start before winter set in. During November 1951, temperatures averaged 6 to 9 degrees below normal but above normal snow fall provided good protection for the fall seeded crops.

The spring of 1952 was relatively favorable in that farmers were able to plant about all of the acreage that they had intended. However, the weather was such that crop seedings were interrupted. Part of the oats were seeded during the last week in March while most of the remaining seeding was delayed until the week ending April 21. A considerable acreage of corn was planted during the week of May 12 which is early for Indiana corn. The week ending May 19 was also favorable for field work but excessive precipitation halted work for the rest of the month. Most of the remaining corn acreage was planted the first week of June. This meant that corn was planted in two stages: about 40 percent before May 19 and the balance after the first of June. Soybean planting progressed in about the same way as did corn planting.

The growing season temperatures were relatively favorable over the state with temperatures normal or slightly above up to August 1. The above normal temperatures were not extreme except for one or two days at the end of July which was a critical period for corn tasseling and pollination. Precipitation was ample throughout the growing season in the northern third of the state but was slightly short in parts of central Indiana. Dry weather from wheat harvest to the end of the season lowered yields in the southern third of the state, particularly in the southeastern counties. These lowered yields were offset by splendid yields in the northern third of the state.

Extremely favorable weather occurred during the small grain and hay harvest periods. Wheat in particular was harvested under nearly ideal conditions so that moisture content was generally under 14 percent as it came from the combine. Late planted oats were again delayed by rain at harvest time in the northern part of the state. Loss of hay from rain damage was less than usual for the state as a whole.

Harvest weather continued favorable for the soybean and corn crops. The crops were fully matured with excellent ripening weather throughout the fall. October weather was ideal and the soybean harvest was practically completed by October 15 while corn picking was at least two-thirds completed by November 1.

Corn averaged 50 bushels per acre with above average yields in northern counties offsetting the lowered yields in the southern part of the state. With the large acreage, the total corn crop was the third largest produced in Indiana.

The winter wheat yield of 24.0 bushels per acre is the second highest on record. However, production was below record levels because of the smaller acreage harvested.

The record soybean yield of 23.5 bushels per acre on 1,638,000 acres gave a total production slightly above the previous record crop.

The all-hay yield at 1.40 tons per acre was about average, but hay quality was better than usual.

The 1952 season was not too favorable for fruit production. Apples and peaches suffered damage from the severe weather of November 1951. Dry summer weather further reduced apple production in southern orchards. Pears and grapes fell far below average in production.

Truck crop yields were generally favorable. While yields of cabbage and sweet corn were below average, the yield of cucumbers was especially good. The yield of processing tomatoes was below the record of 1951, but was above the average yield. The fresh market crops made better than average yields except for strawberries which were winter injured in November 1951 and further damaged by rains at harvest time. Watermelons and cantaloups made very high yields and were of exceptional quality.

The fall of 1952 was below normal in the amount of rainfall except for generally heavy rains during the week of November 24. Precipitation during this week averaged about three times the normal weekly amount. Farmers seeded about 1,556,000 acres of winter wheat or 100 percent of the 1952 seeded acreage. Condition of the wheat seeding on December 1 was below average due to delayed germination and poor growth as a result of dry conditions, especially in the southern two tiers of counties. The prospects for the 1953 wheat crop depend to a greater extent than usual on possible winter damage to the weaker stands of wheat.

LIVESTOCK SUMMARY JANUARY 1, 1952

Crop Reporting Districts

cattle, 18 percent for milk cows, 10 percent for sheep, 7 percent for chickens, 5 percent for turkeys, and 10 percent for horses. The percentage decline of values was 3 percent for mules and for hogs.

The total inventory value rose from \$487,756,000 to \$555,883,000, a gain of 14 percent.

Increase in the numbers of younger milk stock offset the decrease in cows and heifers over 2 years old. All other classes of cattle except steers over 1 year made increases with beef cows up 13 percent, beef heifers 25 percent, calves 9 percent, and bulls 3 percent.

While there was no change in the 70,000 on feed, stock sheep showed gains of 4 percent in ewes and 5 percent in ewe lambs. This is the third successive increase in stock sheep numbers.

The 1951 lamb crop was 111 percent of the breeding ewes of January 1, or

Indiana had a notable increase in the number of meat animals the past year.

In 1951 all cattle numbers increased 4 percent, but cows and heifers two years old or over kept for milk declined 2 percent. The number of hogs increased 6 percent as did stock sheep. There were 3 percent more chickens at the end of the year than at the beginning. Turkey breeders decreased 9 percent although the number of turkeys raised was 15 percent larger. Work animal numbers continued downward with horses dropping 18 percent, and mules 10 percent.

Values per head increased sharply for all cattle, for milk cows, and for sheep, chickens, and turkeys. Horses were also higher, but mules were lower, and hog values were down slightly. The percentage gain in value in the year was 16 percent for all

299,000 head. The wool crop of 354,000 fleeces averaged 7.4 pounds. The clip of 2,620,000 pounds averaged \$1.03 cents per pound.

The 1951 spring pig crop was 4,336,000 head. The fall crop was 4,299,000 head. The yearly total of 8,635,000 head was 2 percent larger than the previous record crop of 1943, and nearly a million more than in any other year. Out of the January 1 total of 4,983,000, the 708,000 sows and 725,000 other hogs over six months exceeded last year by 10 percent. The fall pigs still under 6 months exceeded last year by 4 percent.

Farm chickens showed a 3 percent increase in layers and a 3 percent decrease in other chickens. The rate of lay was high throughout the year and the production of 2,590 million eggs was about 5 percent above the previous year. Farm chickens raised numbered 27,442,000. This number is lower than in the past where the same number of layers were produced because more farmers are buying sexed pullet chicks. Commercial broiler chicks placed in the state in 1951 totaled 38,004,000 an increase of about 30 percent over last year. The estimated production of broilers in 1951 was 33,923,000 birds.

United States

For the third successive year livestock and poultry numbers on farms showed a net increase, the gain in 1951 being 4 percent. The upturn was marked by a substantial increase in cattle numbers to a new record high of 88 million head. Modest increases took place in hog, sheep and chicken numbers, and turkeys were notably higher. Cows and heifers 2 years old and older kept for milk were down about one percent from the previous year. Horse and mule numbers continued to decline at an accelerated rate.

Most species of livestock increased during 1951 as generally favorable prices for livestock and livestock products encouraged production. The rate of expansion slowed down in the latter part of the year as a result of decreased feed supplies and higher feed costs in relation to price of livestock and livestock products. Most production rates were well above average, with record or near record achievement. In 1951 producers attained the record high number of pigs saved per litter and a record egg laying rate for farm chicken flocks.

Feeding activity at the end of the year was at a record level for cattle and sharply higher than a year earlier for sheep and lambs. Large quantities of soft corn that required immediate feeding stimulated demand for cattle and sheep in some Corn Belt States. On January 1, a record number of cattle and calves were on grain feed for market—11 percent more than a year earlier. The 1951 pig crop was 5 percent large than in 1950. The number of sheep and lambs on farms and ranches was above a year ago, with increases in both stock sheep, and sheep and lambs on feed. Considerably more ewe lambs were being kept for breeding purposes than a year earlier. Commercial hatchery production during 1951 was at a record level for both baby chick and turkey poult production. Commercial broiler production continued to set a record high, and 5 percent more farm chickens were raised. A record high number of turkeys was raised in 1951. A marked expansion took place in production of turkey fryers on a year round basis.

On the other hand, hog production had apparently reached a peak in 1951—the third largest in history—and was starting to decline. Farrowings fell below the previous year after August 1951. For 1952, farmers intend to decrease their spring pig crop. They also plan to buy 10 percent fewer baby chicks. Their holdings of milk cows were slightly smaller than last January 1. Dry conditions in Texas forced liquidation of livestock, especially sheep and goats. The Texas goat population dropped 6 percent in 1951 after showing an increase in 1950.

Production of feed grains in 1951 was down 7 percent from 1950 and the lowest since 1947. However, it was larger than in any of the 21 years prior to

1942. The supply of feed grains on farms on January 1, 1952 per animal unit was about 10 percent below last year. Supplies of hay for the current season, made up of a near record harvest and an average carry-over, are the largest of record. Nevertheless, there are local dry areas where hay supplies are short and in other sections heavy feeding has caused a tight situation to develop.

Farm value of livestock and poultry reached a record of 19.6 billion dollars on January 1, 1952, 14 percent above last year, the previous high, and 90 percent above the 10-year average. Except for hogs, horses and mules, the total value of every species was above last year.

The number of cattle and calves increased about six million head, or 7 percent during 1951. The January 1, 1952 number exceeds the previous peak in 1945 by nearly 2½ million head. All classes of cattle, except milk cows, showed gains from a year ago. The increase in cattle numbers came mostly in cattle and calves being kept for beef production. Beef cows reached a record high of over 20 million head at the beginning of the year, while milk cow numbers were at their lowest level since 1930. The larger steer and calf inventories reflected the sharply increased numbers of cattle and calves on feed January 1. A large calf crop in 1951, together with a marked decrease in cattle and calf slaughter accounted for the 7 percent gain in cattle inventories. Imports from Canada during 1951 were considerably less than in 1950, with the decrease coming in both breeding and feeder type cattle. The quarantine placed on Mexican imports of cattle in 1946 was in force during 1951.

Sheep inventories increased 4 percent from January 1, 1951 to 1952. Stock sheep numbers were up 2 percent and sheep and lambs on feed were up 15 percent. Total slaughter of sheep and lambs in 1951 was 14 percent less than in 1950 and the smallest in the 52 years of record. The increased January 1, 1952 inventory was due to the decreased slaughter and the slightly larger 1951 lamb crop. The large number of ewe lambs in stock sheep inventories is sufficient to provide replacements to continue an upward trend in sheep inventories. Texas had a small lamb crop in 1951, and conditions were generally unfavorable for sheep and lamb production. As a result Texas stock sheep numbers dropped 10 percent during the past year. In nearly all of the other 12 Western States stock sheep inventories were unchanged or up from the previous year. Stock sheep numbers increased or held steady during the past year in all of the Native sheep States except Kentucky.

Hog numbers on farms were up 2 percent, or approximately one million head from last year. Hogs under 6 months of age increased about 2 percent reflecting the larger pig crop of last fall. The number of sows and gilts was down 8 percent from January 1951, pointing to the decrease in the intentions to farrow sows this spring. Other hogs over 6 months of age were up 6 percent. Marketing of hogs from the 1951 spring pig crop began early last fall. During the last quarter of 1951, marketing weights were slightly lighter than in the previous year.

Horse and mule numbers continued their decline which has been underway now for over 25 years. The number of horse and mule colts raised in 1951 again fell far below the number required to maintain present inventories. This points to a further reduction in work stock numbers.

Chickens on farms January 1, excluding commercial broilers, were up 2 percent from January 1, 1951 but still 7 percent below the average. Pullets were up 6 percent following an increase of 5 percent in chickens raised in 1951, while the number of hens decreased 1 percent. Turkey inventories on farms January 1 increased 15 percent, and breeder hens increased 16 percent.

Miner M. Justin, Robert E. Straszheim, Byron R. Bookhout, Eugene H. Carter
